### 3 - One-Year Migration History<sup>3</sup>

The following tables show average one-year migration matrices with and without notches for each individual rating segment over the respective credit rating history. Intuitively, the figures represent the probability of migrating from one credit rating class to another (or remaining in the same credit rating class) over the course of a year. The concentration of migration rates along the main diagonal demonstrates that credit ratings are highly stable.

## 4 – Benchmarking to fedafin Master Scale<sup>4</sup>

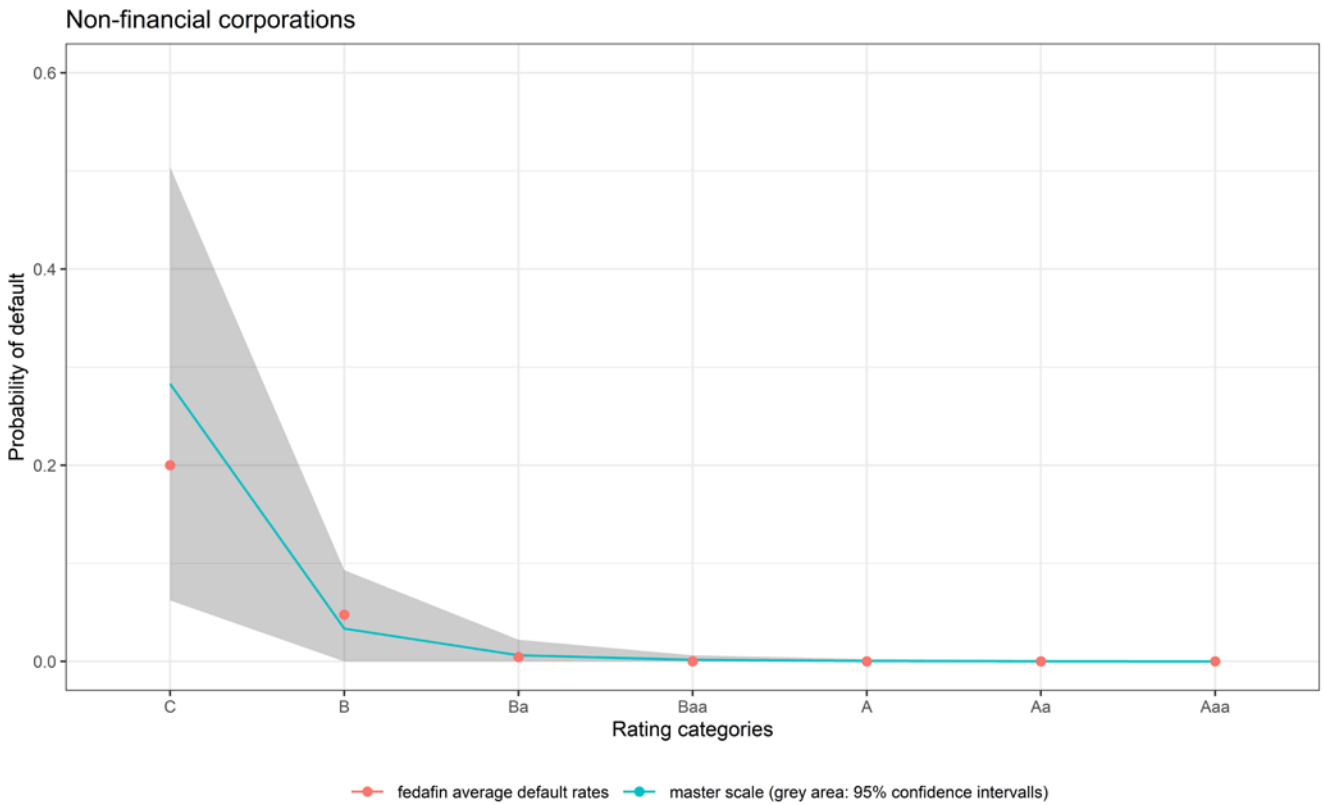

The following figures compare real average default rates per credit rating class with fedafin's master scale. Both rating segments' average default rates lie within the master scale's confidence intervals.

### Local & Regional Government Rating (PD Ø 2000 - 2021)

<sup>4</sup> Fedafin does not report benchmarking results or cumulative default rates for the sectors „financial corporates“, „real estate corporates“ and „mortgages“, because no defaults occurred so far.

Non-Financial Corporate Rating (PD Ø 2003 – 2021)

## 5 - Estimated Cumulative Default Rates (CDR)

The following tables show the estimated cumulative default rates per rating class and segment. The cumulative default rates are estimated based on Markov matrix multiplication because the existing sample does not allow an empirical determination using the cohort method (insufficient sample size and duration of the rating history).
